2-2 OPTION INSTALLATIONS

• UI-100 DSP UNIT

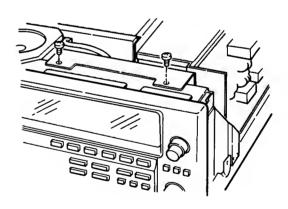

The UI-100 DSP UNIT provides noise reduction, DSP modulation/demodulation, DSP filters, auto notch, auto APF, etc. for the IC-775. The IC-775DSP has a DSP unit as standard.

Install the DSP unit as follows:

- ① Remove the top cover as described on p. 2-1.
- ② Connect the 3 plugs (attached to the backside of the front panel) to the appropriate connectors as shown below.

- ③ Insert the DSP unit into the slots at the backside of the main and sub dials.
- 4 Tighten the 2 supplied screws as shown below.
- (5) Replace the top cover.

After installation, read the instruction manual as for a "DSP-equipped type" transceiver. The [AF LPF] switch functions as the auto notch switch in SSB mode and the auto APF switch in CW mode.

• OPTIONAL FILTER

After installing optional filters, the transceiver has 3* kinds of selectivity for 2nd and 3rd IF filters to provide better S/N (signal-to-noise ratio), or to reject nearby interference.

* FM mode: 2 kinds of selectivity

Following optional filters are available.

| IF | Filter | Passband width | Used selectivity |
|-----|--------|-----------------|-------------------------------|
| | FL-101 | 250 Hz/ – 6 dB | CW nar. |
| 2nd | FL-102 | 6.0 kHz/ – 6 dB | SSB wide, AM med., FM nar. |
| | FL-223 | 1.9 kHz/-6 dB | SSB nar. |
| 3rd | FL-53A | 250 Hz/ – 6 dB | CW nar. |
| Sra | FL-222 | 1.9 kHz/ – 6 dB | SSB nar. |

When only 1 filter is installed for selectivity, such as a FL-101 installed but no FL-53A installed, optimum performance cannot be obtained for the selectivity and the twin PBT function does not operate correctly. Both filters, such as FL-101 and FL-53A, should be installed.

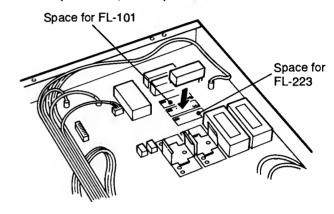

FILTER SELECTION

FILTER SELECTION

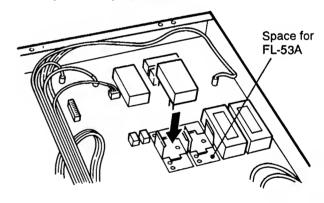

After the filter(s) are installed, act filter(s) in H-set mode. If this is not installed filter(s) cannot be selected. After the filter(s) are installed, activate the optional filter(s) in H-set mode. If this is not correctly set, the

- (1) Remove the top and bottom covers as described on p. 2-1.
- 2 Insert the filter(s) to the proper position. The locations are shown in the figures below.
 - The FL-53A and FL-222 must be installed in the proper direction.
 - The FL-101, FL-102 or FL-223 work regardless of the direction they are installed in.
- 3 Replace the top and bottom covers.

FL-102 (or FL-101, FL-223) Installation

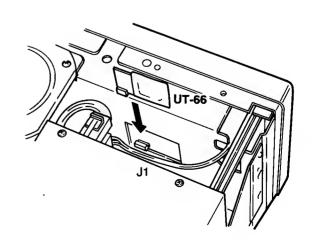

FL-222 (or FL-53A) Installation

• CR-282 HIGH-STABILITY CRYSTAL UNIT

By replacing the original crystal unit with this unit, the total frequency stability of the transceiver will be improved.

CR-282 frequency stability:

 ± 0.5 ppm (-30 °C to +60 °C; -22 °F to +140 °F)

- ① Remove the top and bottom covers as described on p. 2-1.

- ③ Unsolder the leads of the installed crystal, then remove the crystal.
 - Use a desoldering braid.
- 4 Unsolder the 4 positions on the PLL unit where the CR-282 will be installed.
- ⑤ Install the CR-282 in the PLL unit, paying attention to orientation.
 - Symbols on the bottom of the CR-282 must be identically matched with symbols on the P.C. board.
- 6 Bend the leads of the CR-282 at the foil side of the P.C. board and solder them as shown in figure 2 at right.
- 7 Trim the leads even with the solder points.
- (8) Replace the PLL unit, ribbon cable and covers.

After changing the crystal unit, frequency adjustment is necessary with L4 on the PLL unit.

- 4 Change the AC fuse to an appropriate one.
- ⑤ Replace the internal shield cover and plug in the 3 power connectors. Replace the regulator unit, then check the movement of the [POWER] switch. Replace the remaining units, covers and screws.

AC fuse when you change the AC input voltage. An incorrect fuse may pose a fire hazard.

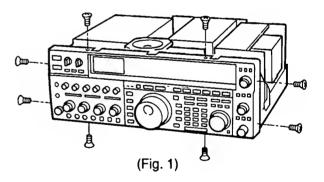

- 12 A FGMB fuse for 100-120 V versions
- 5 A high breaking capacity fuse for 220–240 V versions

BACKUP BATTERY REPLACEMENT

The transceiver has a lithium backup battery on the inside of the front panel (MAIN unit) for retaining operating conditions. The usual life of the backup battery is approximately 5 years.

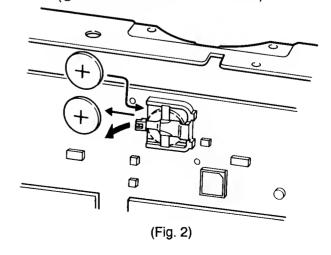

When the backup battery is exhausted, the transceiver transmits and receives normally but cannot retain operating conditions except for memory channels.

- CAUTION: If the lithium battery is incorrectly replaced, it could explode. Replace with a CR-2032 or equivalent type.
- ① Remove the top and bottom covers as described on p. 2-1.
- ② Remove 8 screws from the front panel as shown in figure 1 at right.
- ③ Remove the front panel.
- 4 Replace the backup battery as shown in figure 2 at right.
- 5 Reassemble the front panel.
 - Check that the [POWER] switch works smoothly.
- 6 Replace the top and bottom covers.
- **CAUTION:** After replacing the lithium battery, turn power ON and OFF, otherwise, the lithium battery will become exhausted rapidly.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 RF SWITCHING CIRCUIT (CTRL AND RF UNITS)

The RF switching circuit leads receive signals to bandpass filters from an antenna connector while receiving. While transmitting, this circuit leads the signals from the RF power amplifier to the antenna connector.

RF signals from an antenna connector, pass through the antenna selecting relay (RL3), transmit/receive switching relays (RL1, RL2, RL4, RL12) and low-pass filter (L15, L16, C48-C50), and are then applied to the RF unit via J10 (RF unit J7-1).

The signals from the CTRL unit are either bypassed or are applied to the 6 dB (R132, RL2) and/or 12 dB attenuators (R131, RL1). By selecting the attenuators, 0 (bypass), 6, 12 and 18 dB attenuations are obtained. The signals are then applied to RF filters.

4-1-2 RF BANDPASS FILTER CIRCUIT (RF UNIT)

RF bandpass filters pass only the desired band signals and suppress any undesired band signals. The RF circuit has 9 bandpass filters and 2 low-pass filters.

(1) 0.1-0.5 MHz

The signals pass through a low-pass filter (L84-L86, C141-C145), bypass the preamplifiers and are then applied to the RF amplifiers (Q7, Q14).

(2) 0.5-1.6 MHz

The signals pass through a 10 dB attenuator (R117) to prevent distortion caused by very strong signals and are then applied to a low-pass filter (L88, L89, C148-C150). The filtered signals bypass the preamplifiers and are then applied to the RF amplifiers (Q7, Q14).

(3) 1.6-30.0 MHz

The signals pass through a high-pass filter (L134, L135, L137, C226-C229) to suppress strong signals below 1.6 MHz. The filtered signals are applied to one of 9 bandpass filters as below, a PIN attenuator (D42), and then applied to or bypassing the preamplifier circuit.

Used RF filter

| Band | Control signal | Input diode | Band | Control signal | Input diode |

| 0.5-1.6 MHz | B2 | D19(1/2) | 8-11 MHz | B8 | D27(1/2) |

| 4-8 MHz | B6 | D25(1/2) | | | |

4-1-3 PREAMPLIFIER CIRCUITS (RF UNIT) (1.6 MHz and above)

The IC-775/DSP has 2 gain levels of preamplifier circuits. One has 10 dB gain over a wideband frequency range and the other has 16 dB gain for 21-28 MHz bands.

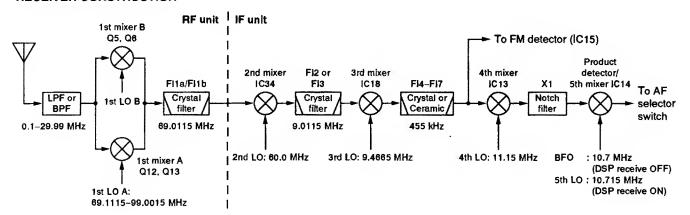

When the [PREAMP/ATT] switch is set to [PRE1] or [PRE2], the signals above 1.6 MHz are applied to the preamplifier 1 (Q22, Q23) or preamplifier 2 (Q24, Q25) clrcuit, respectively. Amplified or bypassed signals are applied to the 1st mixer circuits.

4-1-4 RF AMPLIFIER AND 1st MIXER **CIRCUITS (RF UNIT)**

The 1st mixer circuit mixes the receive signals with the 1st LO signal to convert the receive signal frequencies to a 69 MHz 1st IF. The IC-775/DSP has two 1st mixer circuits for the dualwatch function.

The signals from the preamplifier circuit, or signals which bypass the preamplifiers, are divided at L52. Each signal is applied to a 30 MHz cut-off low-pass filter, RF amplifier (Q7 or Q14) and then to a 1st mixer (Q5/Q6 or Q12/Q13).

RECEIVER CONSTRUCTION

Each 1st LO signal (69.1115–99.0015 MHz) enters the RF unit from the PLL unit via P1 or P2. The LO signals are amplified at Q1 or Q8, filtered by a low-pass filter, and then, applied to each 1st mixer.

1st IF frequency

| Mode | Frequency |
|----------|-------------|
| SSB | 69.0115 MHz |
| CW, RTTY | 69.0106 MHz |
| AM, FM | 69.0100 MHz |

4-1-5 1st IF CIRCUIT (RF UNIT)

The 1st IF circuit filters and amplifies the 1st IF signals. The 1st IF signals combined at L34 are applied to an MCF (Monolithic Crystal Filter; FI1) to suppress out-of-band signals.

The levels of the converted 1st IF signals are adjusted at PIN attenuators (D1, D3, D4 and D5, D7, D8) controlled by the [BALANCE] control. The signals are applied to a 1st IF amplifier (Q4 or Q11) and then combined at L34.

The combined signals pass through the pair of MCF's (FI1) and are amplified at Q15. The signals are applied to the 2nd mixer (IC34) in the IF unit via P3 (IF unit J8). The AGC voltage is supplied to the 2nd gate of Q15.

4-1-6 2nd MIXER CIRCUIT (IF UNIT)

The 2nd mixer circuit mixes the amplified 1st IF signals and 2nd LO signal (60.00 MHz) to convert the 1st IF to a 2nd IF.

The 1st IF signals from the RF unit are converted to 9 MHz 2nd IF signals at the 2nd mixer (IC34).

The 2nd IF signals are applied to FI1 to suppress undesired signals such as the 2nd LO signal, and are then applied to the noise blanker gate (D68–D71).

2nd IF frequency

| Mode | Frequency |
|----------|------------|
| SSB | 9.0115 MHz |
| CW, RTTY | 9.0106 MHz |
| AM, FM | 9.0100 MHz |

4-1-7 NOISE BLANKER CIRCUIT (IF UNIT)

The noise blanker circuit detects pulse type noise, and turns OFF the signal line when noise appears.

The 2nd IF signals from FI1 are applied to the noise blanker gate (D68–D71). A portion of the signals from FI1 are amplified at the noise amplifiers (Q47–Q49), then detected at the noise detector (D75) to convert the noise components to DC voltages.

The signals are then applied to the noise blanker switch (Q57–Q59). At the moment the detected voltage exceeds the Q59's or Q58's threshold level, Q57 outputs a blanking signal to close the noise blanker gate (D68–D71) by applying reverse-biased voltage. Q58 and Q59 are activated by narrow-width pulses and high level pulses, respectively. The [NB LEVEL] control adjusts the threshold level of Q58 and Q59.

The detected voltage is also applied to the noise blanker AGC circuit (Q52) and is then fed back to the noise amplifiers (Q47–Q49) as a bias voltage. The noise AGC circuit prevents closure of the noise blanker gate for long periods by non-pulse-type noise. The time constant of the noise blanker AGC circuit is determined by R55 and C41. Q54–Q56 expand the blank width when [NB WIDE] is turned ON. The [BLK-WIDTH] control adjusts the blank width.

The signals from the noise blanker gate are then applied to the 2nd IF circuit.

4-1-8 2nd IF CIRCUIT (IF UNIT)

The 2nd IF circuit amplifies and filters the 2nd IF signals.

The signals passed through the noise blanker gate (D68-D71) are amplified at Q46 and applied to a 2nd IF filter as shown in the following table.

2nd IF filters

| Mode | Used filter | Control signal |
|------------------------------------|-----------------|----------------|
| CW/RTTY wide, SSB med., AM nar. | FL-80 (F12) | 2N24 |

The filtered or bypassed signals are then applied to the 3rd mixer circuit through a buffer amplifier (Q38).

4-1-9 3rd MIXER AND 3rd IF CIRCUITS (IF UNIT)

The 3rd mixer circuit mixes the 2nd IF signals and the 3rd LO signal to obtain the 3rd IF (455 kHz) signals.

The 2nd IF signals from Q38 are applied to the 3rd mixer (IC18 pin 6). The 3rd LO signal from the PLL unit is applied to the 3rd mixer (IC18 pin 8). The 2nd IF signals are converted to 3rd IF signals. The 3rd IF signals are amplified at Q39, and then applied to one of the 3rd IF filters.

The filtered signals are amplified at Q12, and then applied to the 4th mixer or FM detector circuit.

4-1-10 4th MIXER AND 4th IF CIRCUITS (IF UNIT)

The 4th mixer circuit mixes the 3rd IF signals and the 4th LO signal to obtain the 4th IF (10.6950 MHz) signals.

The 3rd IF signals from Q12 are applied to the 4th mixer (IC13 pin 6), except in FM mode, and are mixed with the 4th LO signal to be converted into 4th IF signals. The 4th IF signals are applied to the IF notch filter (X1), filtered at FI8 and then amplified at Q13 and Q14. R198 sets the total gain.

The 4th IF signals are applied to the AM detector circuit via the buffer-amplifier (Q15) or product detector (IC14 pin 6). IC14 functions as the 5th mixer when the DSP (Digital Signal Processor) receive function is turned ON.

4-1-11 TWIN PBT CIRCUIT (IF UNIT)

The PBT (PassBand Tuning) circuit shifts the center frequency of IF signals to electronically narrow the passband width. The IC-775/DSP has 2 PBT circuit.

The twin PBT circuit shifts the 2nd and 3rd IF within \pm 1.5 kHz. As a result, the 2nd and 3rd IF are shifted from the center frequencies of the 2nd and 3rd IF filters. This means 2nd or 3rd IF signals do not pass through the center of the 2nd or 3rd IF filters because the passband width is fixed in the 2nd or 3rd IF filter. Therefore, the overlap of the 2nd/3rd or 3rd/4th IF filter appears to be narrowed. Since the 3rd and 4th LO frequencies are also shifted the same value as the 2nd and 3rd IF shifts, frequencies are corrected at the detector.

In the IC-775/DSP, the 1st LO frequency is shifted to change the 2nd IF because a fixed 2nd LO frequency (60 MHz) is used. The 1st IF filter (RF unit FI1) and crystal filter (IF unit FI1) have 15 kHz passband widths and do not affect PBT operation.

4-1-12 IF NOTCH CIRCUIT (IF UNIT)

The IF notch circuit attenuates a specified audio frequency in the IF section to increase readability of desired signals.

The IF signals from the 4th mixer (IC13) are applied to the IF notch circuit (X1). The crystal filter has excellent cut-off frequency characteristics and attenuation of more than 45 dB. The IF notch frequency is controlled by shifting the 4th IF to obtain the same attenuation characteristics within the IF band width. The 4th IF frequency can be adjusted with the [NOTCH] control.

When the [NOTCH] switch is turned OFF, the 4th IF signals pass through X1 out of the notch filtering frequency. Therefore, the IF notch circuit is substantially bypassed by the 4th IF signals.

4-1-13 AGC CIRCUIT (IF UNIT)

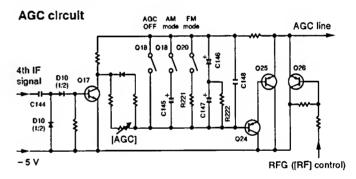

The AGC (Automatic Gain Control) circuit reduces IF amplifier gain to keep the audio output at a constant level.

The receiver gain is determined by the voltage on the AGC line (Q17 collector). Q26 supplies minus voltage to the AGC line and sets the receiver gain with the [RF] control.

The 4th IF signal from the buffer amplifier (Q15) is detected at the AGC detector (D10) and is then applied to the DC amplifier (Q17). -5 V is applied to the Q17 emitter to activate the AGC line using minus voltage.

When receiving strong signals, the detected voltage increases and the AGC voltage decreases via the DC amplifier (Q17). As the AGC voltage is used for the bias voltage of the IF amplifiers (Q13, Q14, Q39, Q46 and RF unit Q15), IF amplifier gain is decreased. The AGC voltage is also applied to the PIN attenuator (D42) in the RF unit to attenuate the received signals before the 1st mixers.

When the strong signal disappears, the AGC line voltage is released by C146-C148 and R222 while in SSB, CW and RTTY mode. While in AM or FM mode, C145 or R221 is connected in parallel to obtain appropriate AGC characteristics, respectively.

4-1-14 S-METER CIRCUIT (IF UNIT)

The S-meter circuit indicates the relative received signal strength while receiving by utilizing the AGC voltage which changes depending on the received signal strength.

The AGC bias voltage (time constant line) is applied to a differential amplifier (IC7b pin 6) where the difference between the AGC and reference voltages is detected.

The resulting S-meter signal passes through the meter switching circuit (IC6 pins 3, 13) via the "SQLV" signal line. The S-meter signal is applied to the main CPU, sub CPU, and then to the S/RF meter on the front panel.

The S-meter signal (SQLV) is also applied to the main CPU (MAIN unit IC12 pin 93) for S-meter squelch detection.

4-1-15 SQUELCH CIRCUIT (MAIN, IF AND SW-A UNITS)

The squelch circuit mutes audio output when the S-meter signal is lower than the [SQL] control setting level.

The S-meter signal is applied to the main CPU (MAIN unit IC12 pin 93) and is compared with the threshold level set by the [SQL] control. The [SQL] setting is picked up at the A/D converter (SW-A unit IC7) and then applied to the sub CPU (IC8). The CPU compares the S-meter signal and [SQL] setting to close or open the squelch.

In addition, the noise squelch signal (FMND) from the FM IF IC is applied to the main CPU (pin 92) in FM mode. A portion of the AF signals from the FM IF IC (IF unit IC15, pin 9) are applied to the active filter section (pin 8) where noise components above 20 kHz are amplified. The signals are rectified at the noise detector section and then output from pin 13. The resulting signal is applied to the main CPU via the "FMND/ASQN" signal line.

4-1-16 SSB/CW DEMODULATOR CIRCUIT (IF UNIT)

While in SSB or CW mode (DSP detection is OFF), the 4th IF signals from Q14 are mixed with the BFO signal from the PLL unit at the product detector (IC14 pin 6). The detected AF signal from IC14 (pin 2) is applied to the AF selector switch (IC16, IC17).

4-1-17 AM DEMODULATOR CIRCUITS (IF UNIT)

While in AM mode (DSP detection is OFF), the 4th IF signals from the IF amplifier (Q14) are amplified at Q15 and detected at D8. The detected AF signal is then applied to the AF selector switch (IC16, IC17) via Q16.

4-1-18 FM DEMODULATOR CIRCUIT (IF UNIT)

While in FM mode, the 3rd IF signals from the buffer amplifier (Q12) are applied to the FM IF IC (IC15 pin 5) where the IF signals are converted into AF signals. X2 is used for quadrature detector. The detected AF signals are then applied to the AF selector switch (IC16, IC17) via Q30 and Q31.

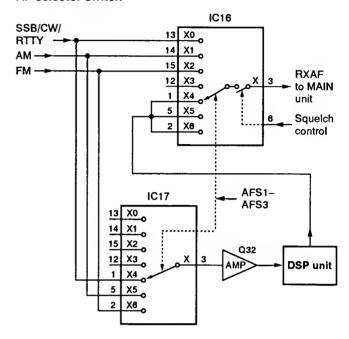

4-1-19 AF SELECTOR SWITCH (IF UNIT)

The AF signal from one of the detector circuits is applied to the AF selector switch (IC16, IC17). IC16 and IC17 consist of 8 analog switches which are selected with a mode signal and the squelch control signal.

to the AF amplifier circuit in the MAIN unit. When the DSP receive function is ON, the AF or 5th IF signal is output from IC17 (pin 3), buffer-amplified at Q32 and then applied to the DSP unit.

The AF signal is output from IC16 (pin 3) and then applied

AF selector switch

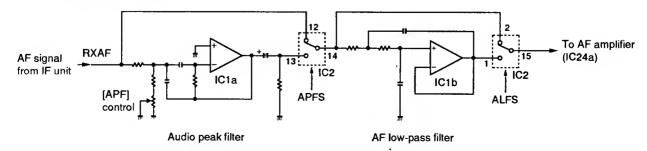

4-1-20 APF AND AF LOW-PASS FILTER **CIRCUITS (MAIN UNIT)**

The APF (Audio Peak Filter) boosts a specified frequency to pick up a desired CW signal, etc. The low-pass filter cuts off higher audio frequencies.

When [APF] is turned ON, the AF signal from the AF selector switch is applied to the APF circuit (IC1a pin 2). The [APF] control adjusts the peak frequency within 200-1000 Hz. IC2 is a triple 2-channel analog switch IC and either applies the AF signal to the APF circuit or bypasses the APF circuit.

When [AF LPF] or [AUTO] is turned ON (deactivating the DSP functions for DSP-equipped types), the AF signal from the APF circuit is applied to the 1.5 kHz cut-off AF low-pass filter (IC1b pin 5). IC2 either applies the AF signal to the low-pass filter or bypasses the low-pass filter.

APF and low-pass filter circuits

4-1-21 AF AMPLIFIER CIRCUIT (MAIN UNIT)

The AF amplifier amplifies the AF input signal to a suitable driving level for the speaker.

The AF signal from the AF low-pass filter (IC1b) is applied to the AF amplifiers (IC24a, IC7a). The CW side tone/ transmit monitor signal and beep tone are amplified at IC7b and IC24b, respectively.

The amplified signals from IC7a, IC7b and IC24b are applied to the [TONE] control (VR-A unit R32) and then to the VCA (Voltage Controlled Amplifier, IC16) circuit. The AF gain setting from the main CPU (pins 42–51) is converted to DC voltage at R58–R77 and applied to the VCA control terminal (IC16 pin 8) via IC20a. The AF signal from IC16 (pin 9) is power-amplified at IC6 to drive the speaker.

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT (MAIN AND IF UNITS)

The microphone amplifier circuit amplifies microphone input signals and outputs the amplified signals to the balanced modulator, DSP (PSN) modulation circuit or FM/AM modulation circuit.

Audio signals from the [MIC] connector are amplified at VCA IC (IC8). The amplified signals from pin 4 are applied to the [MIC TONE] control (VR-A unit R43) and then to the VCA section of IC8 (pin 7). The microphone gain setting from the main CPU (pins 32–41) Is converted to DC voltage at R38–R57 and applied to the VCA control terminal (IC8 pin 8) via IC20b. The resulting signals from pin 9 are then applied to IC10a (IF unit) via the "MIG2" signal line. External modulation input from the [ACC(1)] socket (pin 4) is also applied to IC10a (IF unit).

The amplified signals from IC10a are then applied to the AF selector switch (IC9) for SSB modulation or the amplifier (IC10b) for FM/AM modulation.

When the DSP modulation is turned ON, pins 3/5 and 13/14 of the AF selector switch (IC9) are connected. Therefore, the amplified signal is applied to the DSP unit and the resulting signal (15 kHz IF) is applied to the mixer (IC8) via IC9.

4-2-2 VOX CIRCUIT (MAIN UNIT)

The VOX (Voice-Operated-Transmission) circuit sets transmitting conditions according to voice input.

The microphone signal from IC8 pin 4 passes through the [VOX-GAIN] control (VR-A unit R45) and is amplified at IC23b. The signal is then applied to the VOX comparator (IC23d pin 13) to switch Q23, IC17, IC22, Q5. When voice levels exceed the comparator level, the VOX circuit sets the transceiver to transmit.

On the other hand, a speaker drive signal from the AF power amplifier (IC6) is applied to the anti-VOX comparator (IC23a pin 3) via the [ANTI-VOX] control (VR-A unit R44). When audio output level increases, this comparator cuts out the VOX comparator input using Q6.

4-2-3 BALANCED MODULATOR (IF UNIT)

The balanced modulator converts the AF signal from the microphone amplifier to a 455 kHz IF signal with a BFO (Beat Frequency Oscillator) signal.

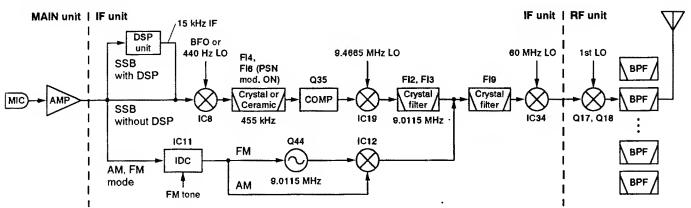

Microphone signals from the AF selector switch (IC9 pins 1, 3) are applied to the balanced modulator (IC8 pin 6). The BFO signal from the PLL unit is applied to IC8 (pin 8) as a carrier signal.

IC8 is a double balanced mixer IC and outputs a double side band (DSB) signal with -40 dB of carrier suppression. R273 and R274 adjust the balanced level of IC8 for maximum carrier suppression. The resulting signal passes through the 455 kHz IF filter (FI4; FI6 when PSN modulation) to suppress unwanted sideband signals.

When DSP modulation is turned ON, IC8 functions as a mixer. IC8 mixes the 15 kHz IF signal with a 440 kHz LO to obtain a 455 kHz IF signal.

In CW and RTTY modes, IC9 plns 2 and 3 are connected to upset the balance of IC8 via R268 for leaking the BFO signal as a carrier signal. CW keying is controlled at Q10 via the "WFM4" signal.

4-2-4 FM AND AM MODULATION CIRCUITS (IF UNIT)

(1) While in FM mode

The microphone signals from IC10a are amplified at IC10b and pass through the limiter amplifier (IC11a) and the splatter filter (IC11b). The subaudible tone signal (67.0–254.1 Hz) from the PLL unit is also applied to IC11a pin 2 for repeater use.

The resulting signals are applied to the modulation circuit (D65) via R292. The modulation circuit changes the reactance of the local oscillator (Q44, X3) to obtain FM modulation. The modulated signal is applied to the transmitter IF amplifier (Q78) via IC12.

(2) While in AM mode

The microphone signals from IC11b are applied to the balanced modulator (IC12) and upset the balance to obtain AM modulation. The local oscillator (Q44, X3) oscillates a 9.0115 MHz signal with no FM modulation.

4-2-5 RF SPEECH COMPRESSOR CIRCUIT (IF UNIT)

The RF speech compressor compresses the transmitter IF signal to increase the average talk power.

When the [COMP] switch is ON, the IF signal from a 455 kHz filter is buffer-amplified at Q33 and is then applied to the RF compressor circuit (Q35, D31). The resulting signal is applied to the IF amplifier (Q36). The 2nd gate of Q36 is controlled by the [DRIVE] control (VR-A unit R22). When the [COMP] switch is OFF, the IF signal bypasses the compressor circuit via D27 and D29.

The resulting signal is mixed with 9.4665 MHz LO signal at IC19 to obtain a 9 MHz IF signal.

4-2-6 IF AMPLIFIER (IF AND RF UNITS)

The 9 MHz IF signal from IC19 passes through the 9 MHz IF filter (FI2) in CW/RTTY modes or in SSB mode with [COMP] ON. The IF signal bypasses the IF filter in SSB mode with [COMP] OFF and in RTTY DATA mode. The signal is amplified at Q78, passes through FI9 to suppress the unwanted signal and is applied to a transmit IF amplifiers (Q45). In FM or AM mode, the 9 MHz IF signal from IC12 passes through FI9 and is then applied to the transmit IF amplifier (Q45).

The amplified signal from Q45 is mixed with the 2nd LO signal (60 MHz) and converted to a 69 MHz IF signal at IC34. IC34 is used in receiving and transmitting. The 69 MHz IF signal enters the RF unit, is amplified at the IF amplifier (Q16) and is then converted to the displayed frequency at the balanced mixer (Q17, Q18) with the 1st LO signal.

The gates of the IF amplifiers (IF unit Q45, RF unit Q16) are controlled by ALC bias voltage from the ALC circuit. R23 adjusts the total transmitter gain.

4-2-7 RF CIRCUIT (RF AND PA UNITS)

The RF circuit amplifies the displayed frequency signal to obtain 200 W of RF output power.

The signals from the balanced mixer (Q17, Q18) is amplified at Q19 and then pass through one of 9 bandpass filters. (Refer to p. 4-1 for used RF filter.) The filtered signal is amplified at Q32, and is then applied to the PA unit.

The signal which enters the PA unit is amplified at the predrive amplifier (Q1), drive amplifier (Q2, Q3) and power amplifier (Q4a, Q4b) in sequence to obtain a stable 200 W of RF output power. The signal from the power amplifier is applied to one of the low-pass filters in the FILTER unit.

4-2-8 LOW-PASS FILTER CIRCUIT (FILTER UNIT)

The low-pass filter circuit consists of 7 Chebyschev lowpass filters to suppress the higher harmonic components.

The signal from the power amplifier is applied to one of the low-pass filters. According to the operating frequency, the I/O expander (IC1) selects a low-pass filter using IC2.

The filtered signal is then applied to one of 2 antenna connectors via the antenna tuner circuit.

4-2-9 ALC CIRCUIT (IF UNIT)

The ALC (Automatic Level Control) circuit controls the gain of IF amplifiers in order for the transceiver to output a constant RF power set by the [PWR] control even when the supplied voltage shifts, etc.

The RF power signal level is detected at D2 (CTRL unit) and applied to the IF unit as the "FOR" voltage.

The "FOR" voltage from the CTRL unit is applied to IC3a (pin 2). The "POC" voltage, controlled by the [PWR] control (VR-A unit R40), is applied to IC3a (pin 3) as the reference voltage.

When the "FOR" voltage exceeds the "POC" voltage, ALC bias voltage from IC3a (pin 1) controls the IF amplifiers (Q45, RF unit Q16) using Q3. This adjusts the output power to the determined level by the [PWR] control until the "FOR" and "POC" voltages are equalized.

In AM mode, IC3a operates as an averaging ALC amplifier with Q5 and C223. Q7 turns ON and the "POC" voltage is shifted for 50 W AM output power (maximum) through R362

The ALC bias voltage from Q3 is also applied to the inversion-amplifier (IC3b pin 6) to obtain an ALC meter signal. It passes through the meter switching circuit (IC6 pin 12) and is then applied to the S/RF meter. IC6 pins 3 and 12 are shorted while transmitting and when the ALC meter is selected with the [METER] switch.

An external ALC input from the [ALC] jack or the [ACC] sockets is applied to the buffer amplifier (Q4). External ALC operation is identical to that of the internal ALC.

4-2-10 APC CIRCUIT (IF UNIT)

The APC (Automatic Power Control) circuit protects the power amplifiers on the PA unit from high SWR and excessive current.

The reflected wave signal appears and increases on the antenna connector when the antenna is mismatched. D1 of the SWR detector circuit (L2, D1, D2) in the CTRL unit detects the signal and applies it to IC2a in the IF unit as the "REF" signal.

When the "REF" signal level increases, IC2a decreases the "ALC" voltage via IC1b to activate the ALC.

For the current APC, the power transistor current is obtained by detecting the voltages ("ID+" and "ID-") which appear at both terminals of a 0.012 Ω resistor (R35) on the PA unit. The detected voltage is applied to the differential amplifier (IC1a pins 2, 3). When the current of the final transistors is more than 18 A, IC1a controls the ALC line via IC1b to prevent excessive current flow.

When activating the antenna tuner with manual tuning, the "PODN" signal turns Q7 ON. As a result, the "POC" voltage is shifted to reduce the output power to 50 W.

4-2-11 TEMPERATURE PROTECTION CIRCUIT (PA UNIT)

The cooling fan (MF1) is activated while transmitting or if the temperature of the final transistors exceeds the preset value.

While transmitting, Q5 and Q8 are turned ON, and provide a voltage to MF1. MF1 rotates at medium speed in this case. Thermistor R29 detects the temperature of Q4b. When the Q4b temperature exceeds 60°C (140°F), R29 activates Q7 and Q9 to accelerate the cooling fan. MF1 rotates at high speed at 80°C (176°F) or more.

R29 keeps the cooling fan rotating even when receiving until the Q4b temperature drops to 40 °C (104°F) or below.

4-2-12 MONITOR CIRCUIT (IF UNIT)

Transmitted IF signals can be monitored to check voice characteristics when [MIC TONE] is adjusted or the transmit low-pass/high-pass filters (DSP functions) are in use.

A portion of the 9 MHz transmit IF signals from Q45 are amplified at Q62 and are then demodulated at IC20 with the MBFO signal from the PLL unit. The demodulated AF signal is applied to the AF selector (IC21). The CW side tone signal (300–900 Hz) from the PLL unit is also applied to the AF selector via the AF gate (Q63). Q63 switches the side tone signal with a keying signal.

The selected AF signal is applied to the AF amplifier circuit in the MAIN unit.

4-2-13 RF, SWR, ALC, COMP, ID, VD METER CIRCUITS (IF UNIT)

While transmitting, RF, SWR, ALC, COMP, ID or VD meter readings are available and can be selected with the [METER] switch.

(1) Power meter circuit

The "FOR" voltage from the CTRL unit is applied to the power meter amplifier (IC2b pin 5). The "POM" signal from IC2b (pin 7) is applied to the meter switch (IC6 pin 15). R456 and C210 are used for peak hold.

(2) SWR meter circuit

The "FOR" voltage, amplified at IC2b, is applied to the SWR meter circuit (IC4, IC5, Q1, Q2). The "REF" voltage, amplified at IC2a, is also applied to the SWR meter circuit. IC4b outputs a signal according to the ratio of "FOR" to "REF" voltage. The signal is applied to the meter switch (IC6 pin 14).

(3) ALC meter circuit

The ALC bias voltage is applied to the inversion-amplifier (IC3b pin 6) and is then applied to the meter switch (IC6 pin 12).

(4) COMP meter circuit

A portion of the RF speech compressor (Q35) output is detected at D33, applied to the buffer-amplifiers (Q37, IC7a pin 3), and is then applied to the meter switch (IC6 pin 1).

(5) ID meter circuit

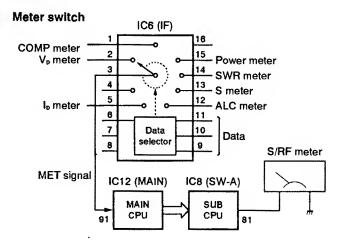

A portion of the current APC circuit (IC1a) output is applied to the meter switch (IC6 pin 5) via R319.

(6) VD meter circuit

The "ID-" voltage is divided at R326 and R327 and Is applied to the meter switch (IC6 pin 2).

(7) Meter switch

According to the transmit meter selection and operating condition, IC6 selects the meter signals and outputs from pin 3 as the "MET" signal. The "MET" signal is applied to the S/RF meter (DISPLAY unit ME1) via the main and sub CPUs.

4-3 PLL CIRCUITS

4-3-1 GENERAL

The PLL unit generates a pair of 1st LO frequencies (69.1115–99.0015 MHz), a 2nd LO frequency (60 MHz), a 3rd LO frequency (9.4665 MHz), a 4th LO frequency (11.15 MHz), a BFO/5th LO frequency (10.7 or 10.715 MHz), a monitor BFO (9.0115 MHz), a CW side tone (300–900 Hz) and an FM subaudible tone (67.0–254.1 Hz).

The 1st LO PLLs adopt a mixerless dual loop PLL system and have 4 VCO circuits. The BFOs and LOs, except the 2nd LO, use DDSs while the 2nd LO uses a fixed frequency double that of the crystal oscillator.

4-3-2 1ST LO PLL CIRCUITS (PLL UNIT)

The 1st LO PLLs contain a main loop and reference loop as a dual loop system. Both PLLs have equivalent circuits and this manual describes only the 1st LO PLL A circuit.

The reference loop generates a 10.655 to 10.737 MHz frequency using a DDS circuit, and the main loop generates a 69.1115 to 99.0015 MHz frequency using the reference loop frequency.

(1) REFERENCE LOOP PLL

The oscillated signal at the reference VCO (Q4, D2, D24, D25) is amplified at the amplifiers (Q5, Q7) and is then applied to the DDS IC (IC1, pin 46). The signal is then divided and detected on phase with the DDS generated frequency.

The detected signal output from IC1 (pin 56) is converted into a DC voltage (lock voltage) at the loop filter (R46, R47, C399) and then fed back to the varactor diode (D2) in the VCO circuit.

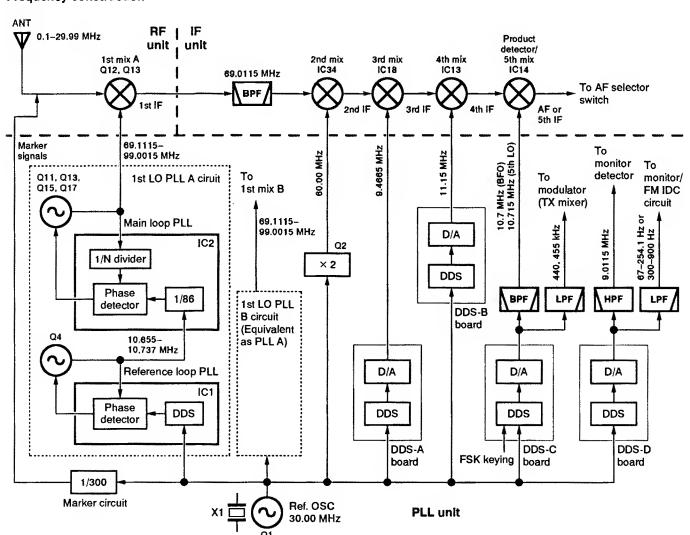

(2) MAIN LOOP PLL

The oscillated signal at one of the main loop VCOs (Q11, Q13, Q15, Q17) is amplified at the buffer amplifiers (Q19, Q22) and is then applied to the PLL IC (IC2, pin 14). The signal is then divided and detected on phase with the reference loop output frequency.

The detected signal output from IC2 (pins 9, 10) is converted into a DC voltage (lock voltage) at the loop filter and then fed back to one of the varactor diodes (D4, D6, D8, D10) in the VCO circuits.

The oscillated signal is amplified at the buffer amplifiers (Q19, Q20, Q21) and then applied to the RF unit as a 1st LO A signal.

Frequency construction

4-3-3 2ND LO AND REFERENCE OSCILLATOR CIRCUITS

The reference oscillator (X1, Q1) generates a 30.0 MHz frequency used for the 6 DDS ICs as a system clock and for the LO output. The oscillated signal is doubled by 2 at Q2 and the 60 MHz frequency is picked up at the bandpass filter (L6, L7). The 60 MHz signal is applied to the IF unit as a 2nd LO signal.

4-3-4 3RD/4TH LO AND RECEIVE/TRANSMIT/ MONITOR BFO CIRCUITS

(1) 3rd LO circuit

The DDS IC (DDS-A board IC1) generates a 10-bit digital signal using the 30 MHz system clock. The digital signal is converted to an analog wave signal at the D/A converter (R13–R32). The analog wave is passed through the bandpass filter, buffer-amplifier (Q43), low-pass filter and is then applied to the IF unit as the 3rd LO signal.

(2) 4th LO circuit

The DDS IC (DDS-B board IC1) generates a 10-bit digital signal. The signal is converted to an analog wave signal at the D/A converter. The analog wave is passed through the bandpass filter, buffer-amplifier (Q44), low-pass filter and is then applied to the IF unit as the 4th LO signal.

(3) Receive BFO/5th LO and transmit BFO circuits

The DDS IC (DDS-C board IC1) generates a 10-bit digital signal. The signal is converted to an analog wave signal at the D/A converter. The analog wave is passed through the low-pass filter, buffer-amplifier (Q46). While transmitting in RTTY mode, the RTTY keying signal is applied to IC1 pin 2 to shift the generated frequency and to obtain 2 frequencies for FSK operation.

While receiving, the 10.7 MHz BFO or 10.715 MHz 5th LO signal passes through the bandpass filter and is then applied to the IF unit via the "RBFO" signal line.

While transmitting, the 455 kHz BFO or 440 kHz LO signal passes through the low-pass filter and is then applied to the IF unit via the "TBFO" signal line.

(4) Monitor BFO, side tone and subaudible tone circuits

The DDS IC (DDS-D board IC1) generates a 10-bit digital signal. The signal is converted to an analog wave signal at the D/A converter. The analog wave is passed through the low-pass filter, buffer-amplifier (Q49).

While transmitting in SSB/RTTY/CW modes with the monitor function, the 9.0115 MHz BFO signal passes through the high-pass filter and is then applied to the IF unit via the "MBFO" signal line.

While transmitting in CW mode without the monitor function, the sidetone signal (300–900 Hz) passes through the low-pass filter and is then applied to the IF unit via the "STON" signal line.

While transmitting in FM mode with the subaudible tone function, the subaudible tone signal (67.0–254.1 Hz) passes through the low-pass filter and is then applied to the IF unit via the "STON" signal line.

4-3-5 MARKER CIRCUITS (MARKER BOARD)

The 30 MHz reference signal is divided by 3 at IC1 and then divided by 100 at IC2 to obtain a 100 kHz signal and its harmonic components signals. The resulting marker signals are applied to the splitter (RF unit L52) which Is before the 1st mixer circuits. Q2 and Q3 supply power to the buffer amplifier (Q1) and switch the marker signal output.

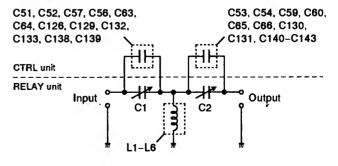

4-4 ANTENNA TUNER CIRCUITS

4-4-1 MATCHING CIRCUIT (RELAY, CTRL AND TUNER UNITS)

The matching circuit is a T-network. Using 2 tuning motors, the matching circuit obtains rapid overall tuning speed.

Using relays (RELAY unit RL1-RL6, CTRL unit RL5-RL10), the relay control signals from the antenna tuner CPU (CTRL unit IC13) ground one of the taps of L1-L8 (RELAY unit) and add condensers (CTRL unit C51-C54, C57-C60, C63-C66, C128-C133, C138-C143). After selecting the coils and condensers, 2 motors (TUNER unit MF1, MF2) adjust C1 and C2 (RELAY unit) using the output of a motor control circuit (IC16) to obtain a low SWR (Standing Wave Ratio).

Equivalent circuit

4-4-2 DETECTOR CIRCUIT (CTRL UNIT)

(1) SWR detector

Forward and reflected power are picked up by L2, detected by D2 and D1, and then amplified at IC1a and IC1b, respectively. The amplified voltages are applied to the antenna tuner CPU (IC13 pins 3 and 2). The CPU detects the SWR.

(2) Reactance components detector

Reactance components are picked up by comparing the phases of the RF current and RF voltage. The RF current is detected by L7 and R19. RF voltage is detected by C10–C12. Both detector voltages are buffer-amplified at IC2a, IC2c, IC3a and IC3d, and are then applied to the phase comparator (IC4, IC5). The output signal of IC5 is detected at D10 and D11. When the RF current phase leads the voltage phase, the detected voltage becomes lower; when the current lags the voltage, the detected voltage becomes higher. The output signal Is amplified at IC6a, and then applied to IC13 (pin 64).

(3) Resistance components detector

Resistance components are picked up by L10, and detected by D12, D13 and Q1. The detected resistance components are amplified at IC6b, and then applied to IC13 (pin 1).

The control circuit of the internal antenna tuner consists of the CPU, EEPROM,* tuning motors and tuning relays.

4-6 DSP CIRCUITS

The DSP (Digital Signal Processor) unit enables digital noise reduction, digital PSN (Phase Shift Network) modulation/demodulation, digital AF automatic notch, digital LPF and HPF, ultra-narrow CW filter and digital automatic APF (Audio Peak Filter).

4-6-1 DSP RECEIVING (DSP UNIT, IC-775DSP only)

When receiving with the DSP function ON, detected AF signals are applied to the DSP unit via the AF selector (IF unit IC17). When receiving with PSN demodulation in SSB/CW/RTTY modes, the product detector (IF unit IC14) functions as a 5th mixer to obtain a 15 kHz IF signal. The IF signal is applied to the DSP unit (J1 pin 8) via IC17 (IF unit) instead of AF signals.

The AF or IF signals pass through the analog switch (IC3 pins 1, 15) and are applied to the A/D converter (IC8). The digital signal is demodulated (5th IF signal) by the PSN method at IC14 and digitally manipulated at IC15. The resulting digital signal is then converted into an analog signal at the D/A converter (IC9).

The converted signal passes through the limiter-amplifier (IC10a) and an analog switch (IC3 pins 13, 14). The signal is amplified at the limiter-amplifier (IC4a), passes through the active low-pass filters (IC5a, IC5b) and is then applied to the switched capacitor filters (IC6, IC7). The cut-off frequencies of IC6 and IC7 can be programmed. The resulting signal passes through IC10b and IC3 (pins 3, 4) and is applied to the AF selector (IC16) in the IF unit.

4-6-2 DSP TRANSMITTING (DSP UNIT, IC-775DSP only)

When transmitting with the DSP function ON, microphone signals are applied to the DSP unit (J1 pin 4) via the AF selector (IF unit IC9).

The AF signals pass through the analog switch (IC3 pins 12, 14), the limiter-amplifier (IC4a), the active low-pass filters (IC5a, IC5b) and are then applied to the switched capacitor filters (IC6, IC7). The cut-off frequencies of IC6 and IC7 can be programmed. The resulting AF signal passes through IC10b and IC3 (pins 4/5, 2/15) and is then converted into a digital signal at the A/D converter (IC8).

The digital signal is modulated by the PSN method at IC14 and digitally manipulated at IC15. The resulting digital signal is then converted into an analog signal at the D/A converter (IC9).

The converted signal passes through the limiter-amplifier (IC10a), filtered at the active high-pass filter (IC11), amplified at IC4b and is applied to the AF selector (IC9) in the IF unit.
